How Is the Shop Performing?

January 2024 to June 2026

Total Revenue	Number of Orders	Average Order Value
2994604	42,825	69.93

Three Key Findings:

Revenue fell by about a third in the year 2026

Monthly revenue held at 95,000 to 115,000 until January 2026, then dropped to 65,000 to 75,000. The cause is fewer orders, not smaller orders.

Revenue is concentrated

Electronics brings in 51% of revenue and Tehran alone brings in 28%. Cheap items sell the most units but earn little.

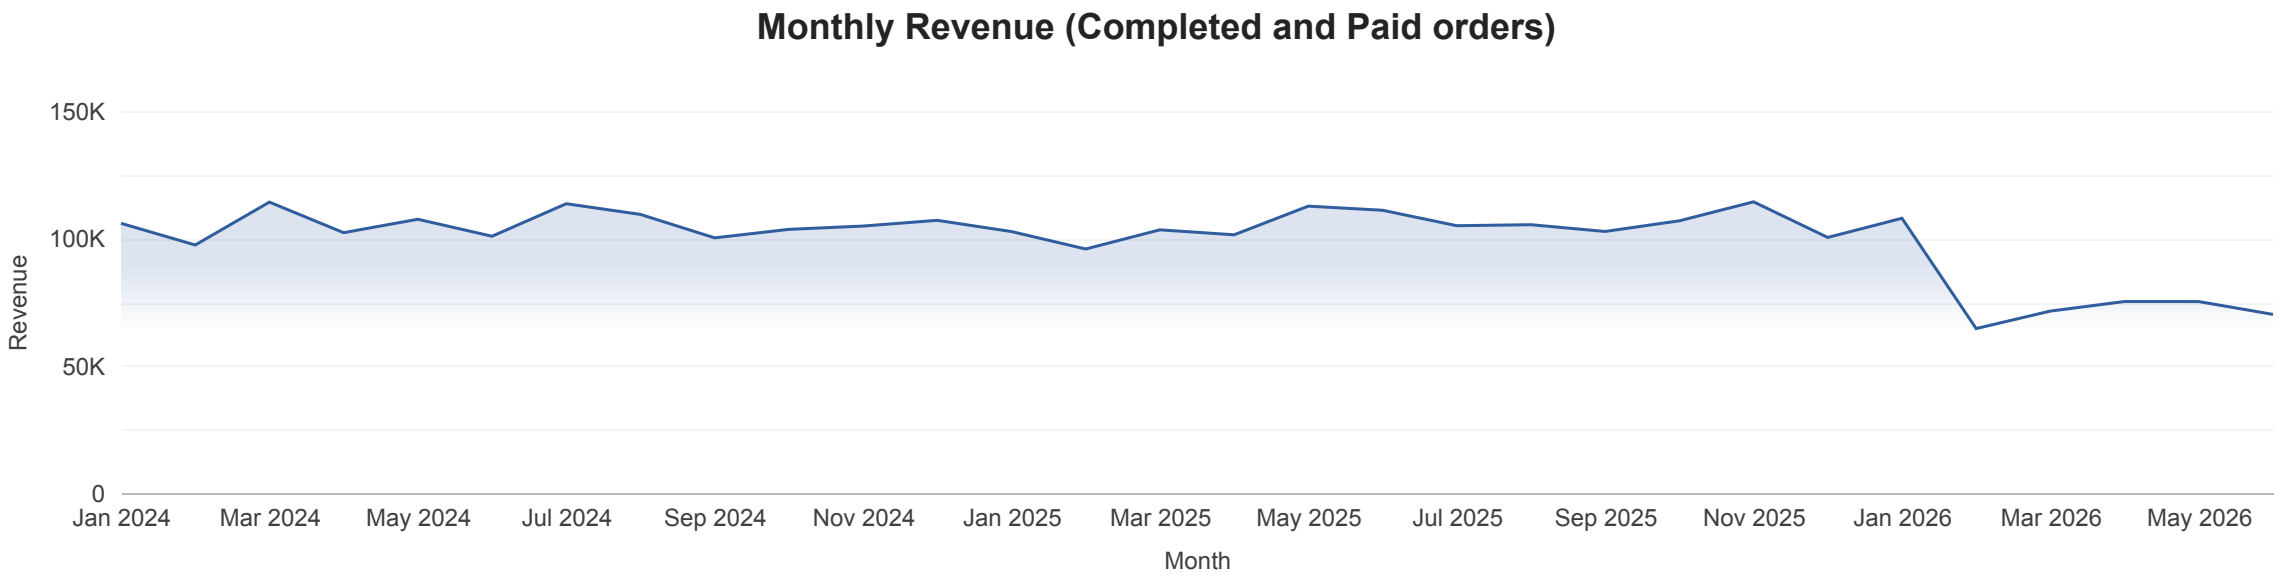

Discounts don't make orders bigger

Customers buy about 1.9 items per order at every discount level, and order value falls from 74.52 with no discount to 56.10 at 30% off.

Revenue Trend

Monthly Revenue, January 2024 to June 2026

So What?

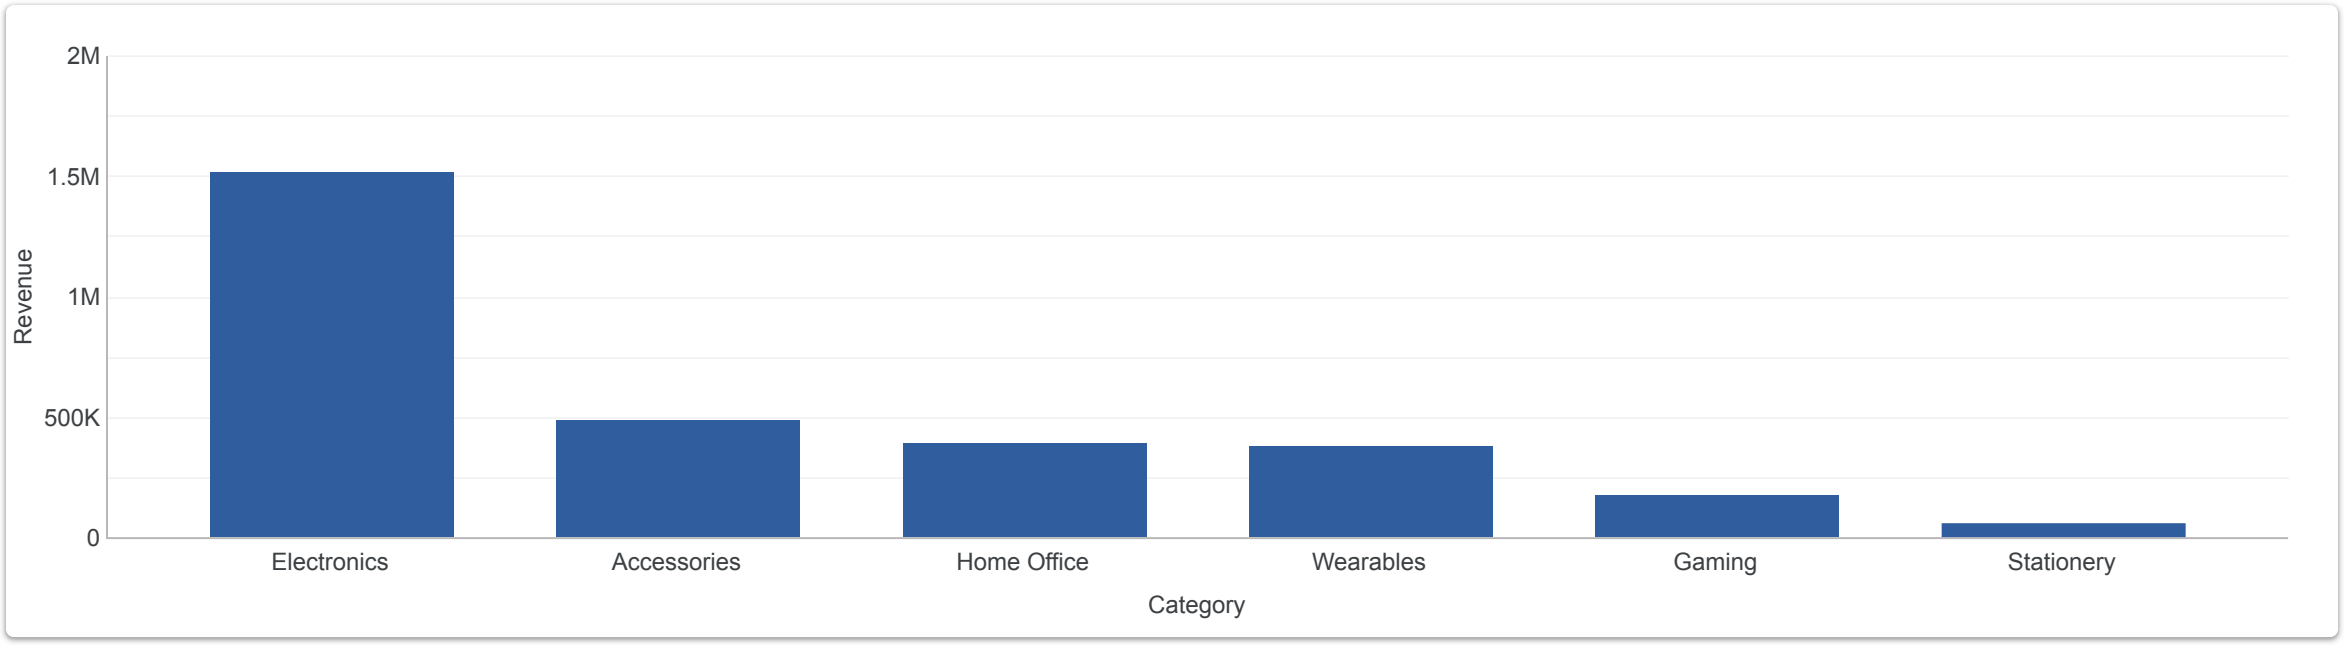

- Revenue was stable at 95,000–115,000 per month until January 2026.
- It then dropped by about one-third to 65,000–75,000 per month.
- The decline is due to fewer orders, not smaller order sizes or more cancellations. There is no recurring seasonal peak in sales.

Products and Categories

Revenue and units sold, completed and paid paid orders

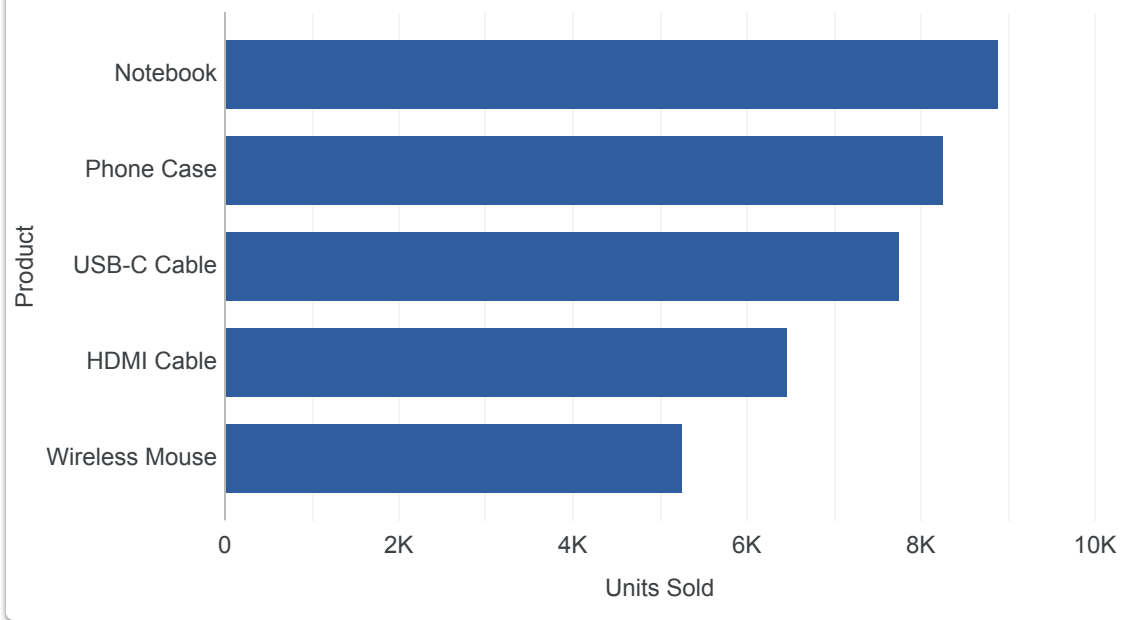

Revenue by Category

Top 5 Products by Revenue

Top 5 Products by Units Sold

So What?

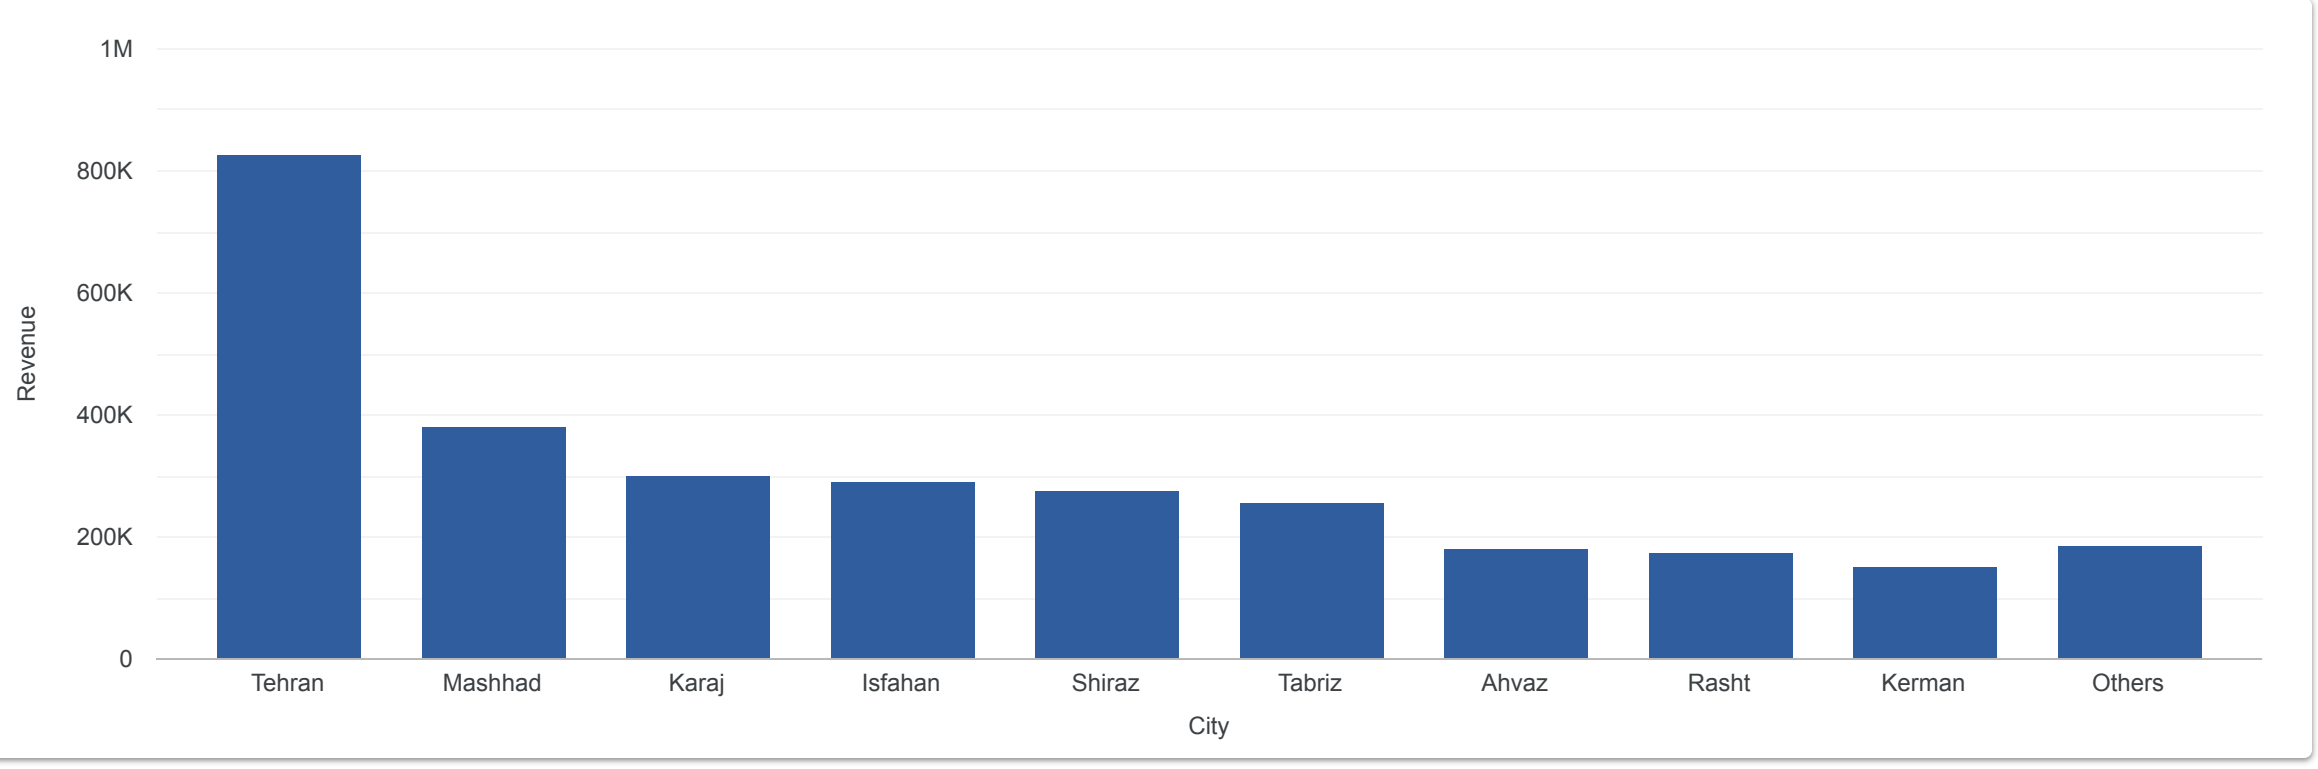

- Electronics brings in about half of all revenue (51%)
- The best sellers by units (notebooks, phone cases and cables) are cheap and earn little revenue.
- No product appears in both the top 5 lists, because price matters as much as volume.

Customers

Revenue by city and customer segment

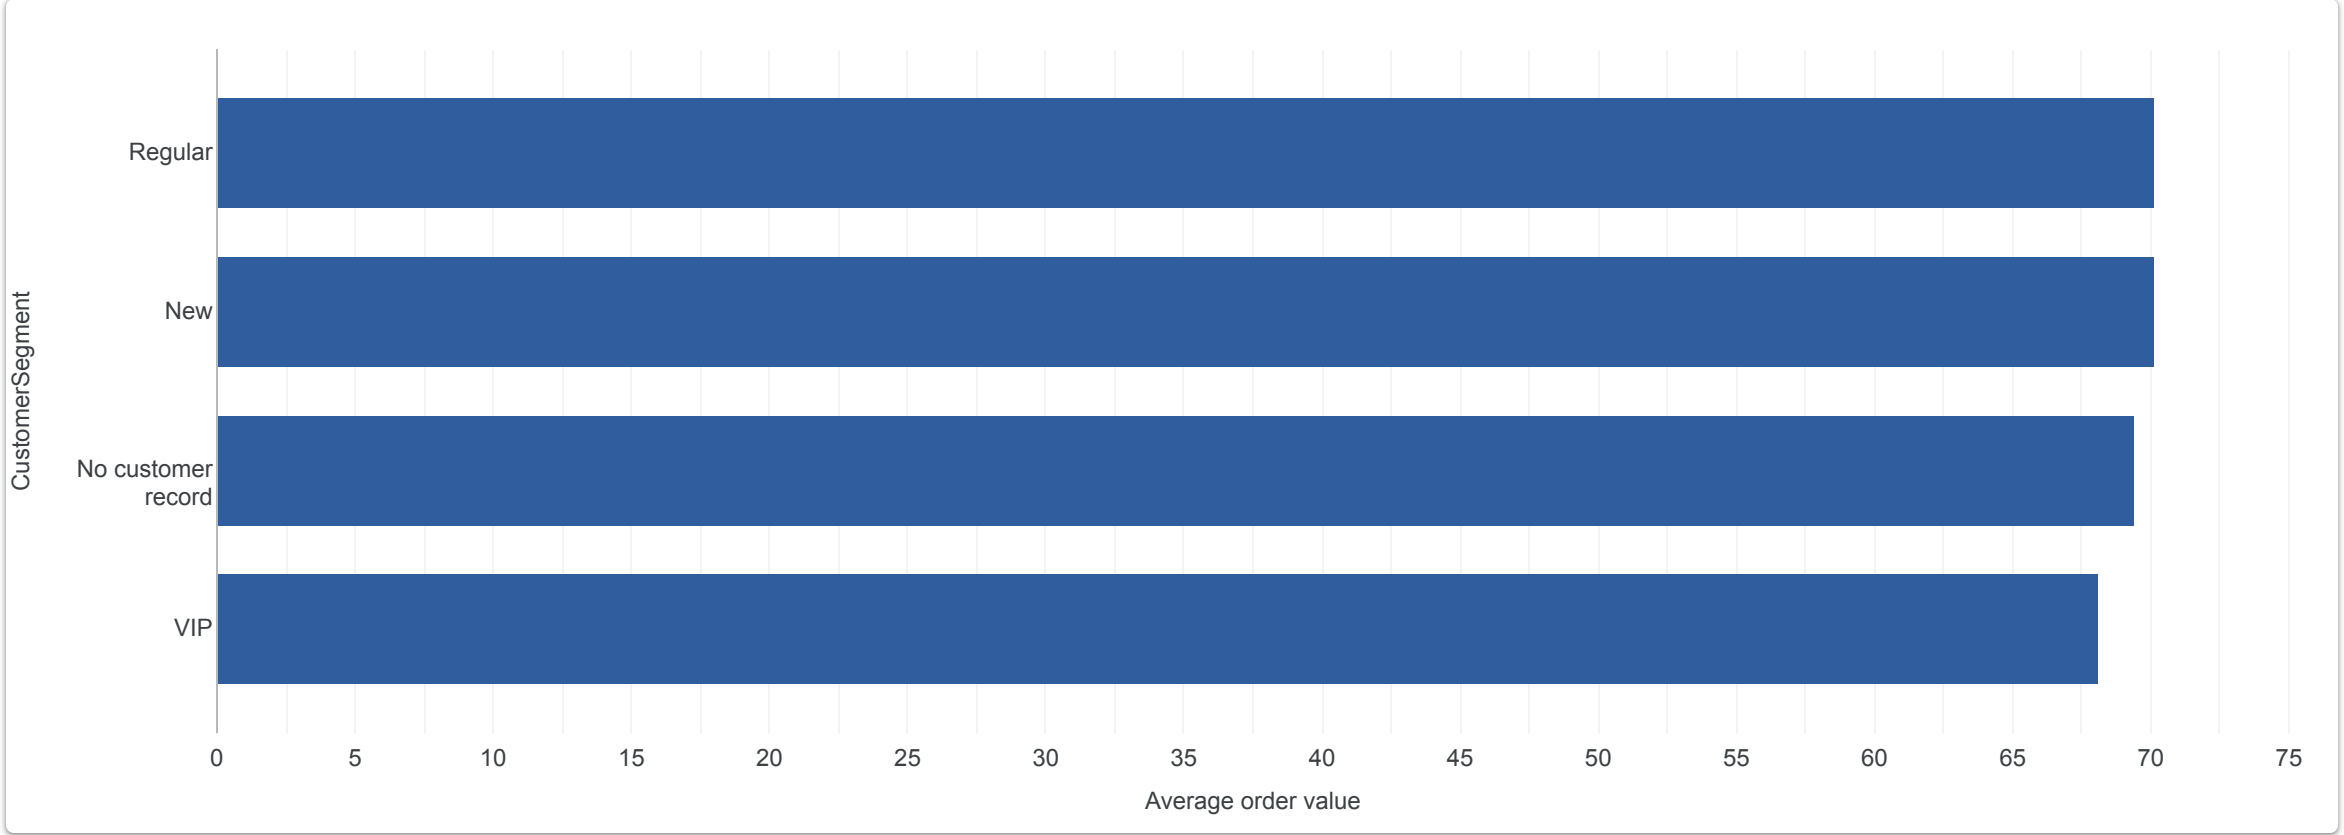

Revenue by City

Revenue by Customer Segment

Average Order Value by Customer Segment

So What?

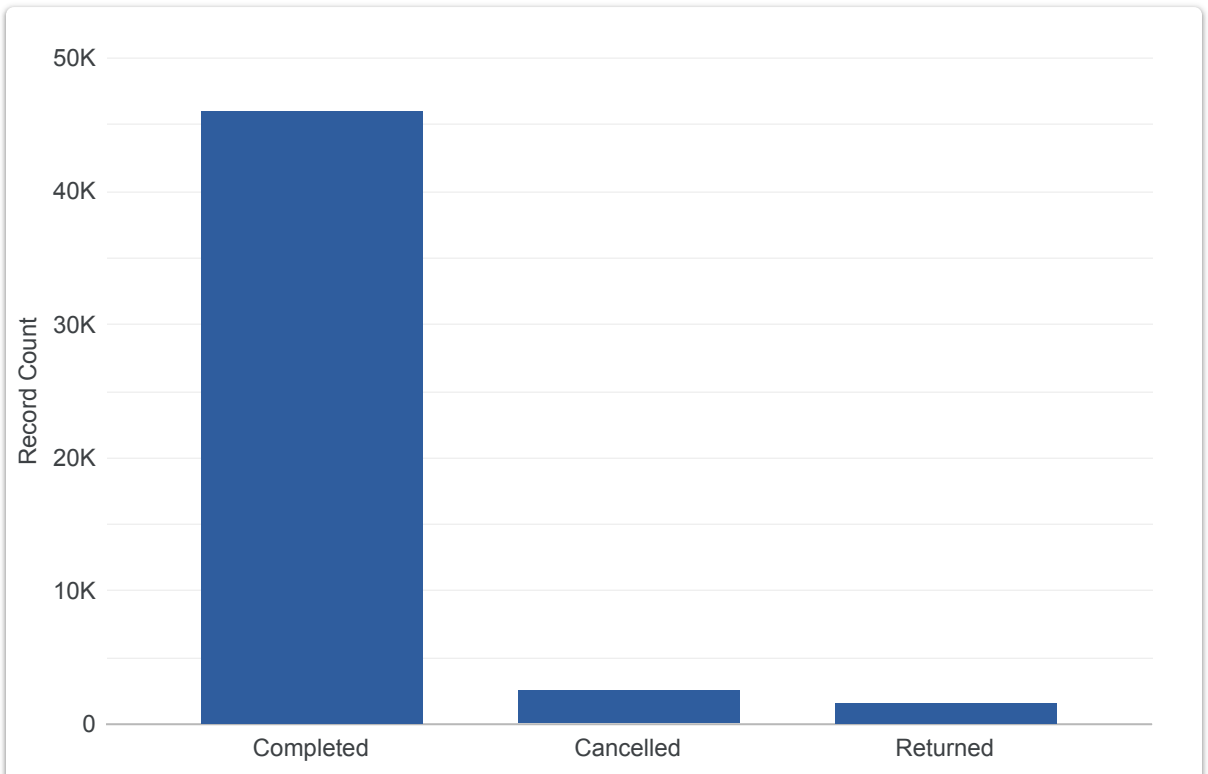

- Tehran brings in over a quarter of revenue (28%), and Tehran, Mashhad and Karaj together bring in about half.
- Regular customers bring in over half (55%), and VIP customers, the smallest group at about 10%, don’t spend more per order than other customers.

“Unknown” = customers with no city recorded. “No customer record” = 30 orders placed under a customer ID that doesn’t exist in the customer list.

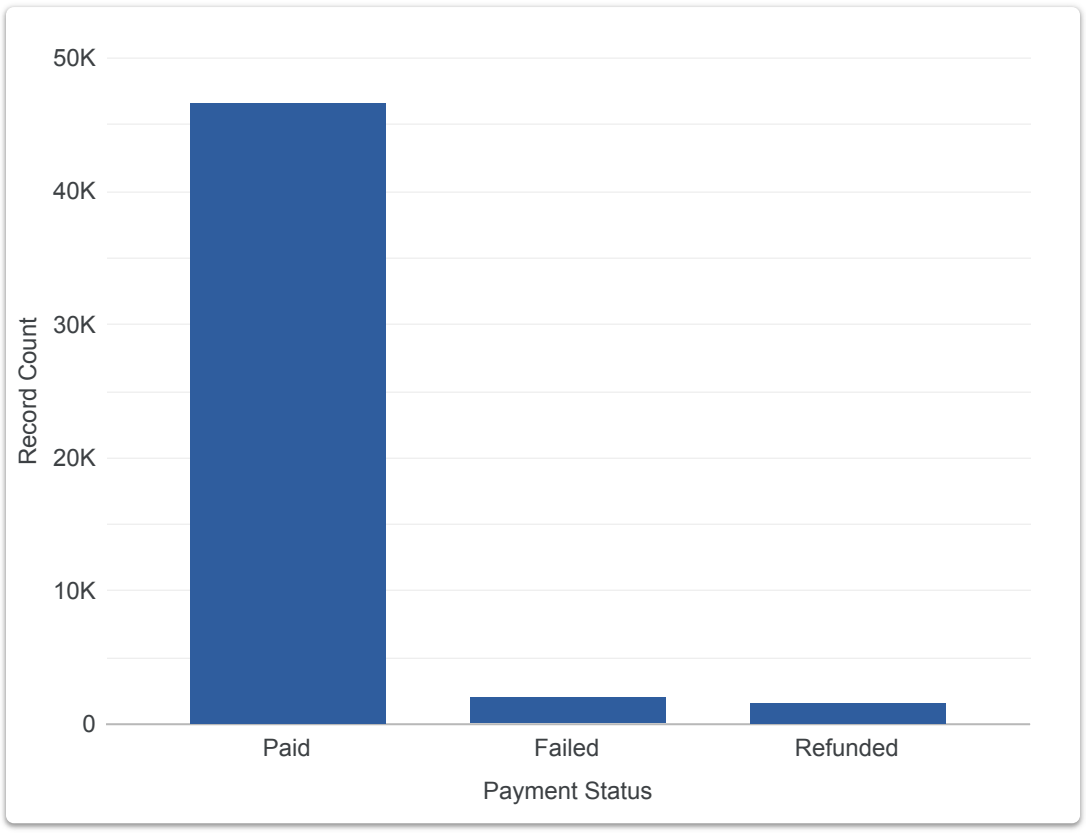

Order Problems and Discounts

Cancelled, returned and failed orders, and the effect of discounts.

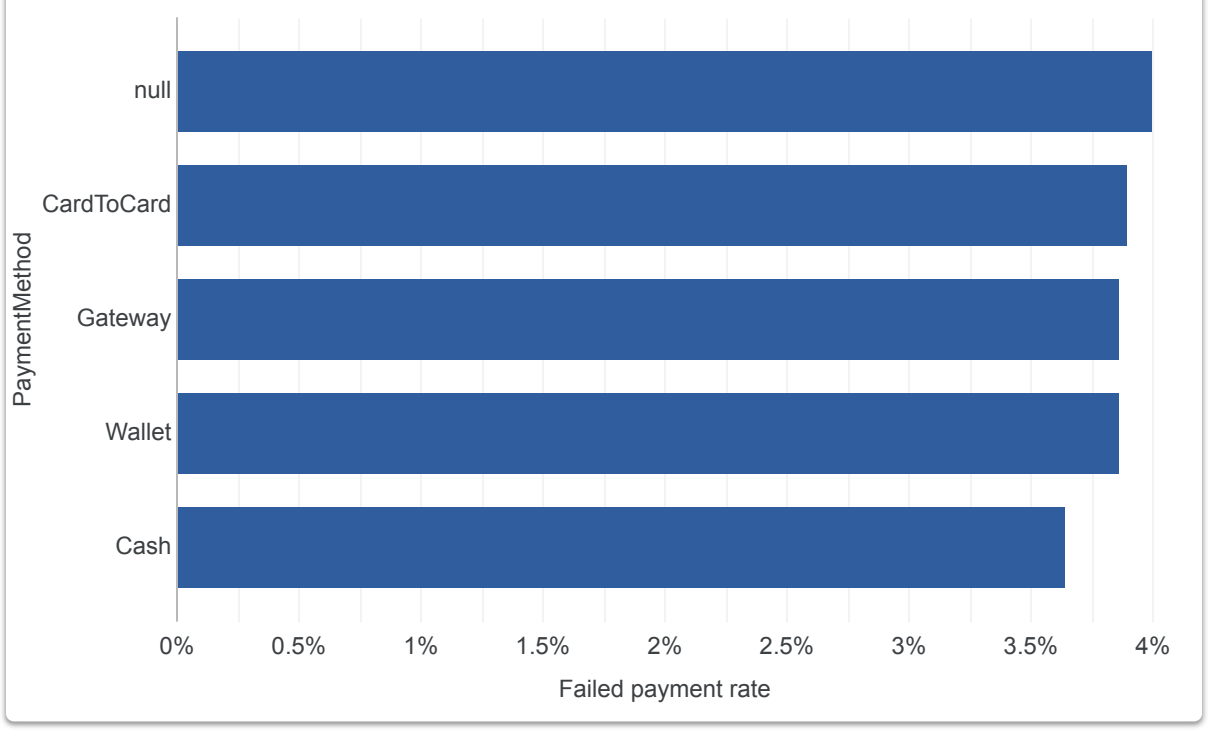

Record Count by Status

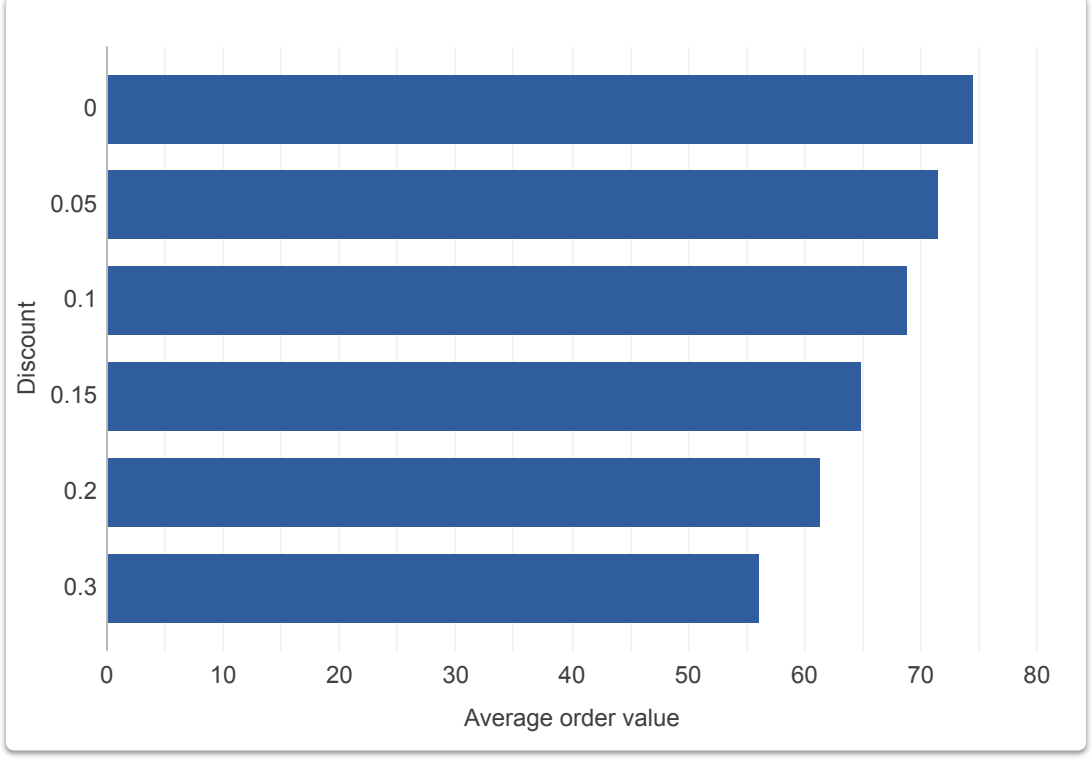

Record Count by Payment Status

Failed Payment Rate by Payment Method

Average Order Value by Discount

So What?

- About 1 order in 12 (8.0%) is cancelled or returned, and 3.8% of payments fail.
- Every payment method fails at about the same rate, so the problem isn’t one particular method.
- Bigger discounts don’t lead to bigger orders: customers buy about 1.9 items per order at every discount level, and order value falls from 74.52 to 56.10 at 30% off.

Order and payment counts use all orders; the discount chart uses Completed and Paid orders only.

Recommendations and Data Notes

RECOMMENDATIONS

1. Find out why orders fell in 2026 and win those customers back.

Orders dropped from about 1,500 a month to about 1,000 from February 2026, while order value and cancellation rates stayed the same. Recovering the lost 500 orders a month would bring back about 35,000 in revenue a month (500 × 69.93). Check what changed that month, such as marketing, stock, pricing or the website.

2. Test lower discounts before cutting them.

Customers buy about 1.9 items per order at every discount level, and order value falls from 74.52 with no discount to 56.10 at 30% off. About 11% of orders (4,747) get 20% or 30% off. The data can't show whether discounts bring in orders that wouldn't have happened, so run a trial of smaller discounts on a few products first.

3. Reduce failed and cancelled orders at checkout.

8.0% of orders are cancelled or returned and 3.8% of payments fail, at nearly the same rate for every payment method. So the fix belongs in the checkout process (payment reminders, retry prompts) and not in dropping one method. About 3,150 Completed orders had a Failed or Refunded payment, and they're excluded from your revenue.

Data notes

(Data problems and how I handled them)

- **Customers**: missing ages filled with the average, missing cities set to Unknown, spelling variants standardised (tehran to Tehran, Mashad to Mashhad).

- **Orders:** 120 duplicate rows removed; 25 rows with a quantity of 0 or below removed; missing quantities set to 1 (the most common value), missing discounts set to 0, missing payment methods set to Unknown.

- **Dates**: 35 orders with no order date are left out of the monthly trend but kept in the totals. 35 payments with no payment date were left blank.

- **Customer ID 999999:** 30 orders under a customer ID that doesn't exist were kept and labelled "No customer record".
- **Revenue rule:** only Completed and Paid orders count as revenue.
